

# IT-234 – database concepts

UNIT 6 – USING SQL COMMANDS TO QUERY EXISTING DATA

# overview

This unit further examines the use of data manipulation language (DML) to query data in an existing database.

You will establish and work with a new database called Northwind in this unit.

# overview

A database deployment script for Northwind is provided, which you will execute within the Microsoft SQL Server Management Studio (SSMS) application.

This deployment script contains both the database structures and data required for the unit assignment.

# overview

---

Once you have data in the tables, what can you do with it?

---

This leads to the fundamental purpose of a database, which is to effectively facilitate data retrieval by users.

---

You will examine different SQL syntax for selecting data into a result set.

---

There are many ways to limit and format the result set into exactly what you require.

# overview

The quandary you must overcome is to determine if the result set has returned correct results or not.

A well-formed SQL query should return something.

But you will need to analyze the results to determine if what was returned is what you asked for and if what you asked for is really what you wanted.

Sounds confusing at first, but do not worry; a little practice is all you will need.

# overview

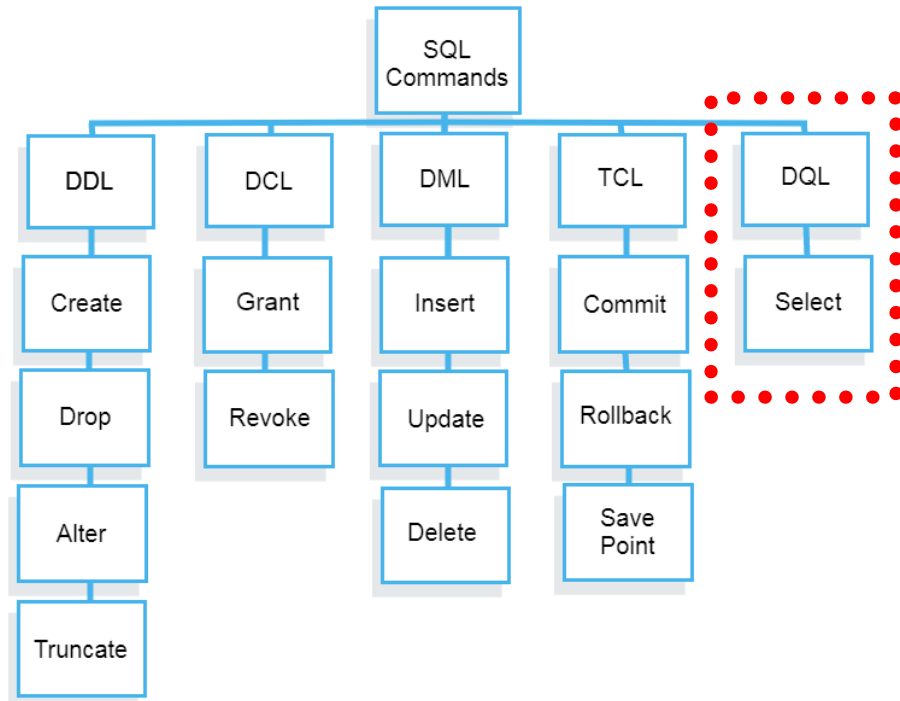

---

After completing this unit, you should be able to:

- Use DML commands to query existing tables.

# Types of SQL

- ▶ Here are five types of widely used SQL queries.
  - Data Definition Language (DDL)
  - Data Manipulation Language (DML)
  - Data Control Language (DCL)
  - Transaction Control Language (TCL)
  - Data Query Language (DQL)

# TYPES OF SQL

# Data Query Language (DQL)

DQL commands are basically SELECT statements.

SELECT statements let you query the database to find information in one or more tables and return the query as a result set.

A result set is an array structure; or more precisely, a result set is a two-dimensional array.

# Data Query Language (DQL)

- ▶ Clauses of the SELECT statement:
  - ▶ **SELECT**
    - List the columns (and expressions) to be returned from the query
  - ▶ **FROM**
    - Indicate the table(s) or view(s) from which data will be obtained
  - ▶ **WHERE**
    - Indicate the conditions under which a row will be included in the result
  - ▶ **GROUP BY**
    - Indicate categorization of results
  - ▶ **HAVING**
    - Indicate the conditions under which a category (group) will be included
  - ▶ **ORDER BY**
    - Sorts the result according to specified criteria

```
SELECT 1;  
SELECT 'ABC';
```

00 %

Results Messages

	(No column name)
1	1

	(No column name)
1	ABC

# SELECT Statements

## Selecting a Literal Value

Perhaps the simplest form of a `SELECT` statement is that used to return a literal value. A *literal value* is one that you specify exactly. It is not data that come from the database.

## Using the `SELECT` Statement

You use the `SELECT` statement to retrieve data from SQL Server. T-SQL requires only the word `SELECT` followed by at least one item in what is called a *select-list*.

# SELECT Statements

## Retrieving from a Table

You will usually want to retrieve data from a table instead of literal values. After all, if you already know what value you want, you probably don't need to execute a query to get that value.

```
SELECT <column1>, <column2> FROM <schema>.<table>;
```

```
USE AdventureWorks;  
GO  
SELECT BusinessEntityID, JobTitle  
FROM HumanResources.Employee;
```

	BusinessEntityID	JobTitle
1	1	Chief Executive Officer
2	2	Vice President of Engineering
3	3	Engineering Manager
4	4	Senior Tool Designer
5	5	Design Engineer
6	6	Design Engineer
7	7	Research and Development Manager
8	8	Research and Development Engineer
9	9	Research and Development Engineer
10	10	Research and Development Manager

Product		
ProductID	Name	ListPrice
1	Widget	2.99
2	Gizmo	1.79
3	Thingybob	3.49

**Select All  
Columns**

```
SELECT * FROM Product;
```

ProductID	Name	ListPrice
1	Widget	2.99
2	Gizmo	1.79
3	Thingybob	3.49

Product		
ProductID	Name	ListPrice
1	Widget	2.99
2	Gizmo	1.79
3	Thingybob	3.49

```
SELECT Name, ListPrice  
FROM Product;
```

Name	ListPrice
Widget	2.99
Gizmo	1.79
Thingybob	3.49

**Select  
Specific  
Columns**

EXAMPLE

Product		
ProductID	Name	ListPrice
1	Widget	2.99
2	Gizmo	1.79
3	Thingybob	3.49

```
SELECT Name AS Product, ListPrice * 0.9 AS SalePrice  
FROM Product;
```

**Expressions  
& Aliases**

Product	SalePrice
Widget	2.69
Gizmo	1.61
Thingybob	3.14

EXAMPLE

## Adding a WHERE Clause

To filter the rows returned from a query, you will add a `WHERE` clause to your `SELECT` statement. The database engine processes the `WHERE` clause second, right after the `FROM` clause. The `WHERE` clause will contain expressions, called *predicates*, that can be evaluated to `TRUE`, `FALSE`, or `UNKNOWN`.

## Filtering Data

Usually an application requires only a fraction of the rows from a table at any given time. For example, an order-entry application that shows the order history will often need to display the orders for only one customer at a time. There might be millions of orders in the database, but the operator of the software will view only a handful of rows instead of the entire table. Filtering data is a very important part of T-SQL.

```
SELECT <column1>,<column2>  
FROM <schema>.<table>  
WHERE <column> = <value>;
```

# SELECT Statements

Product		
ProductID	Name	ListPrice
1	Widget	2.99
2	Gizmo	1.79
3	Thingybob	3.49

***Find products  
with list price  
less than \$2.75***

```
SELECT Name, ListPrice  
FROM Product  
WHERE ListPrice < 2.75;
```

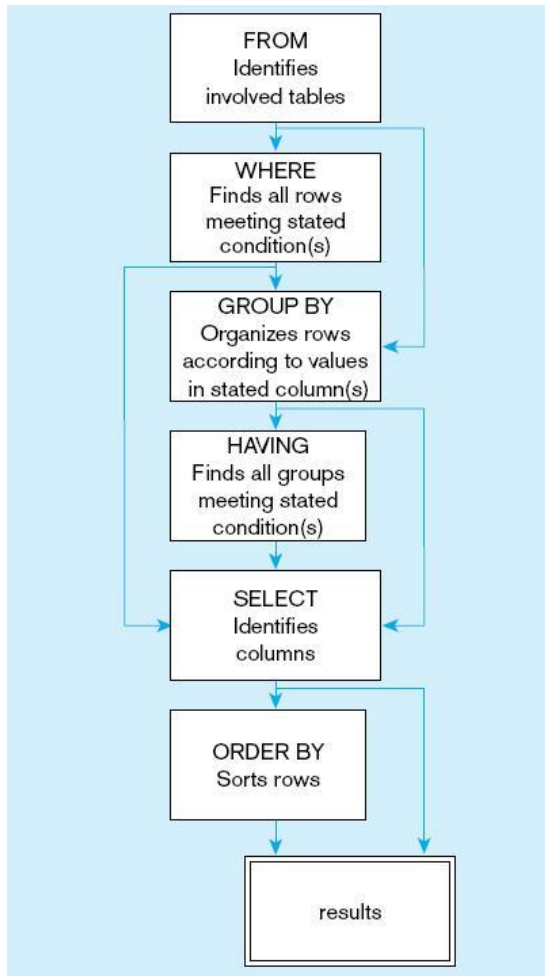

Name	ListPrice
Gizmo	1.79

EXAMPLE

Operator	Meaning
=	Equal to
>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
<>	Not equal to
!=	Not equal to

FROM Sales.SalesOrderHeader
WHERE CustomerID = 11000;
```

```
--2
SELECT CustomerID, SalesOrderID
FROM Sales.SalesOrderHeader
WHERE SalesOrderID = 43793;
```

```
--3
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate = '2005-07-02';
```

```
--4
SELECT BusinessEntityID, LoginID, JobTitle
FROM HumanResources.Employee
WHERE JobTitle = 'Chief Executive Officer';
```

# SELECT Statement Examples

## Using WHERE Clauses with Alternate Operators

Within WHERE clause expressions, you can use many comparison operators, not just the equals sign. Books Online lists the following operators:

- > (*greater than*)
- < (*less than*)
- = (*equals*)
- <= (*less than or equal to*)
- >= (*greater than or equal to*)
- != (*not equal to*)
- <> (*not equal to*)
- !< (*not less than*)
- !> (*not greater than*)

```
--Using a DateTime column
--1
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate > '2005-07-05';

--2
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate < '2005-07-05';

--3
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate >= '2005-07-05';

--4
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate <> '2005-07-05';
```

# SELECT Statement examples

```

--Using a string column
--10
SELECT BusinessEntityID, FirstName
FROM Person.Person
WHERE FirstName <> 'Catherine';

--11
SELECT BusinessEntityID, FirstName
FROM Person.Person
WHERE FirstName != 'Catherine';

--12
SELECT BusinessEntityID,
FROM Person.Person
WHERE FirstName > 'M';

--13
SELECT BusinessEntityID,
FROM Person.Person
WHERE FirstName !> 'M';

--5
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate != '2005-07-05';

--Using a number column
--6
SELECT SalesOrderID, SalesOrderDetailID, OrderQty
FROM Sales.SalesOrderDetail
WHERE OrderQty > 10;

--7
SELECT SalesOrderID, SalesOrderDetailID, OrderQty
FROM Sales.SalesOrderDetail
WHERE OrderQty <= 10;

--8
SELECT SalesOrderID, SalesOrderDetailID, OrderQty
FROM Sales.SalesOrderDetail
WHERE OrderQty <> 10;

--9
SELECT SalesOrderID, SalesOrderDetailID, OrderQty
FROM Sales.SalesOrderDetail
WHERE OrderQty != 10;

```

## SELECT Statement Examples

## Using BETWEEN

BETWEEN is another useful operator you can use in the WHERE clause to specify an inclusive range of values. It is frequently used with dates but can be used with string and numeric data as well. Here is the syntax for BETWEEN:

```
SELECT <column1>,<column2>
FROM <schema>.<table>
WHERE <column> BETWEEN <value1> AND <value2>;
```

	CustomerID	SalesOrderID	OrderDate
1	27645	43702	2005-07-02 00:00:00.000
2	16624	43703	2005-07-02 00:00:00.000
3	11005	43704	2005-07-02 00:00:00.000
4	11011	43705	2005-07-02 00:00:00.000

	CustomerID	SalesOrderID	OrderDate
1	25000	73018	2008-06-15 00:00:00.000
2	25001	61662	2008-01-08 00:00:00.000
3	25002	61397	2008-01-03 00:00:00.000
4	25003	60269	2007-12-18 00:00:00.000

	BusinessEntityID	JobTitle
1	1	Chief Executive Officer
2	5	Design Engineer
3	6	Design Engineer
4	15	Design Engineer

```
--1
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate BETWEEN '2005-07-02' AND '2005-07-04';

--2
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE CustomerID BETWEEN 25000 AND 25005;

--3
SELECT BusinessEntityID, JobTitle
FROM HumanResources.Employee
WHERE JobTitle BETWEEN 'C' and 'E';
```

# SELECT Statements

## Using BETWEEN with NOT

To find values outside a particular range of values, you write the WHERE clause expression using BETWEEN along with the NOT keyword. In this case, the query returns any rows outside the range.

	CustomerID	SalesOrderID	OrderDate
1	27645	43702	2005-07-02 00:00:00.000
2	16624	43703	2005-07-02 00:00:00.000
3	11005	43704	2005-07-02 00:00:00.000
4	11011	43705	2005-07-02 00:00:00.000

	CustomerID	SalesOrderID	OrderDate
1	25000	73018	2008-06-15 00:00:00.000
2	25001	61662	2008-01-08 00:00:00.000
3	25002	61397	2008-01-03 00:00:00.000
4	25003	60269	2007-12-18 00:00:00.000

	BusinessEntityID	JobTitle
1	1	Chief Executive Officer
2	5	Design Engineer
3	6	Design Engineer
4	15	Design Engineer

```
--1
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE OrderDate NOT BETWEEN '2005-07-02' AND '2005-07-04';

--2
SELECT CustomerID, SalesOrderID, OrderDate
FROM Sales.SalesOrderHeader
WHERE CustomerID NOT BETWEEN 25000 AND 25005;

--3
SELECT BusinessEntityID, JobTitle
FROM HumanResources.Employee
WHERE JobTitle NOT BETWEEN 'C' and 'E';
```

# SELECT Statements

THE RECORDS BELOW WILL NOT BE IN THE RESULT SETS!!!!

## Filtering on Date and Time

Some temporal data columns store the time as well as the date. If you attempt to filter on such a column specifying only the date, you may retrieve incomplete results.

```
--1  
SELECT ID, MyDate, MyValue  
FROM #DateTimeExample  
WHERE MyDate = '2009-01-03';
```

	ID	MyDate	MyValue
1	2	2009-01-03 13:00:00	Trike
2	3	2009-01-03 13:10:00	Bell
3	4	2009-01-03 17:35:00	Seat

```
--2  
SELECT ID, MyDate, MyValue  
FROM #DateTimeExample  
WHERE MyDate BETWEEN '2009-01-03 00:00:00' AND '2009-01-03 23:59:59';
```

# SELECT Statements

## Using WHERE Clauses with Two Predicates

So far, the examples have shown only one condition or predicate in the WHERE clause, but the WHERE clause can be much more complex. They can have multiple predicates by using the logical operators AND and OR.

	BusinessEntityID	FirstName	MiddleName	LastName
1	1525	Ken	NULL	Myer
2	203	Ken	L	Myer

	BusinessEntityID	FirstName	MiddleName	LastName
1	1459	Deanna	NULL	Meyer
2	1455	Eric	B.	Meyer
3	1457	Helen	M.	Meyer
4	2140	Ken	NULL	Meyer
5	1523	Dorothy	J.	Myer
6	1525	Ken	NULL	Myer
7	203	Ken	L	Myer
8	2319	Linda	NULL	Myer

```
--1
SELECT BusinessEntityID, FirstName, MiddleName, LastName
FROM Person.Person
WHERE FirstName = 'Ken' AND LastName = 'Myer';

--2
SELECT BusinessEntityID, FirstName, MiddleName, LastName
FROM Person.Person
WHERE LastName = 'Myer' OR LastName = 'Meyer';
```

# SELECT Statements

## Using the IN Operator

The **IN** operator is very useful when a set of multiple values must be compared to the same column. Follow the **IN** operator with a list of possible values for a column within parentheses. Here is the syntax:

```
SELECT <column1>,<column2>  
FROM <schema>.<table>  
WHERE <column> IN (<value1>,<value2>);
```

```
--1  
SELECT BusinessEntityID,FirstName,MiddleName,LastName  
FROM Person.Person  
WHERE FirstName = 'Ken' AND  
      LastName IN ('Myer','Meyer');
```

	BusinessEntityID	FirstName	MiddleName	LastName
1	2140	Ken	NULL	Meyer
2	1525	Ken	NULL	Myer
3	203	Ken	L	Myer

```
--2  
SELECT TerritoryID, Name  
FROM Sales.SalesTerritory  
WHERE TerritoryID IN (2,2,1,4,5);
```

	TerritoryID	Name
1	1	Northwest
2	2	Northeast
3	4	Southwest
4	5	Southeast

```
--3  
SELECT TerritoryID, Name  
FROM Sales.SalesTerritory  
WHERE TerritoryID NOT IN (2,1,4,5);
```

	TerritoryID	Name
1	9	Australia
2	6	Canada
3	3	Central
4	7	France
5	8	Germany
6	10	United Kingdom

# SELECT Statements

## Using LIKE

Pattern matching is possible by using the `LIKE` operator in the expression instead of equal to (`=`) or one of the other operators. Most of the time, the percent sign (`%`) is used as a wildcard along with `LIKE` to represent zero or more characters. You will also see the underscore (`_`) used as a wildcard to replace exactly one character, but it's not used as often.

```
--1  
SELECT DISTINCT LastName  
FROM Person.Person  
WHERE LastName LIKE 'Sand%';
```

	LastName
1	Sandberg
2	Sanders
3	Sandidge
4	Sandoval

```
--2  
SELECT DISTINCT LastName  
FROM Person.Person  
WHERE LastName NOT LIKE 'Sand%';
```

	LastName
1	Abbas
2	Abel
3	Abercrombie
4	Abolrous

```
--3  
SELECT DISTINCT LastName  
FROM Person.Person  
WHERE LastName LIKE '%z%';
```

	LastName
1	Alvarez
2	Arbelaez
3	Bacalzo
4	Baltazar

```
--4  
SELECT DISTINCT LastName  
FROM Person.Person  
WHERE LastName LIKE 'Bec_';
```

	LastName
1	Beck

# SELECT Statements

## NULL and three-valued logic

In the database world, `NULL` is used to indicate the absence of any data value. For example, at the time of recording the customer information, the email may be unknown, so it is recorded as `NULL` in the database.

Normally, the result of a logical expression is `TRUE` or `FALSE`. However, when `NULL` is involved in the logical evaluation, the result is `UNKNOWN`. This is called a three-valued logic: `TRUE`, `FALSE`, and `UNKNOWN`.

The results of the following comparisons are `UNKNOWN`:

```
NULL = 0
NULL <> 0
NULL > 0
NULL = NULL
```

The syntax for the `IS NULL` condition in SQL Server (Transact-SQL) is: `expression IS NULL`

- If *expression* is a `NULL` value, the condition evaluates to `TRUE`.
- If *expression* is not a `NULL` value, the condition evaluates to `FALSE`.

The syntax for the `IS NOT NULL` condition in SQL Server (Transact-SQL) is: `expression IS NOT NULL`

- If *expression* is NOT a `NULL` value, the condition evaluates to `TRUE`.
- If *expression* is a `NULL` value, the condition evaluates to `FALSE`.

# SELECT Statements

## An Example Illustrating NULL

```
--1 Returns 19,972 rows  
SELECT MiddleName  
FROM Person.Person;
```

```
--2 Returns 291 rows  
SELECT MiddleName  
FROM Person.Person  
WHERE MiddleName = 'B';
```

```
--3 Returns 11,182 but 19,681 were expected  
SELECT MiddleName  
FROM Person.Person  
WHERE MiddleName != 'B';
```

```
--4 Returns 19,681  
SELECT MiddleName  
FROM Person.Person  
WHERE MiddleName IS NULL  
OR MiddleName != 'B';
```

# SELECT Statements

## Sorting Data

You can specify one or more columns in the `ORDER BY` clause separated by commas. The sort order is ascending by default, but you can specify descending order by using the keyword `DESCENDING` or `DESC` after the column name. You can also specify `ASCENDING` or `ASC` if you wish, but the sort order is ascending by default. Here is the syntax for `ORDER BY`:

```
SELECT <column1>,<column2>  
FROM <schema>.<tablename>  
ORDER BY <column1>[<sort direction>],<column2> [<sort direction>]
```

```
--1  
SELECT ProductID, LocationID  
FROM Production.ProductInventory  
ORDER BY LocationID;  
  
--2  
SELECT ProductID, LocationID  
FROM Production.ProductInventory  
ORDER BY ProductID, LocationID DESC;
```

	ProductID	LocationID
1	1	1
2	2	1
3	3	1
4	4	1
5	317	1
6	318	1
7	319	1

	ProductID	LocationID
1	1	50
2	1	6
3	1	1
4	2	50
5	2	6
6	2	1
7	3	50
8	3	6
9	3	1

# SELECT Statements

# Distinct clause

Sometimes, you may want to get only distinct values in a specified column of a table. To do this, you use the SELECT DISTINCT clause as follows:

```
SELECT DISTINCT  
    column_name  
FROM  
    table_name;
```

## Distinct clause

The query returns only distinct values in the specified column.

In other words, it removes the duplicate values in the column from the result set.

# Distinct clause

- ▶ If you use multiple columns as follows:
- ▶ The query uses the combination of values in all specified columns in the SELECT list to evaluate the uniqueness.

```
SELECT DISTINCT  
  
    column_name1,  
    column_name2 ,  
  
    ...  
  
FROM  
  
    table_name;
```

# Distinct clause

If you apply the DISTINCT clause to a column that has NULL, the DISTINCT clause will keep only one NULL and eliminates the other.

In other words, the DISTINCT clause treats all NULL "values" as the same value.

sales.customers

# Distinct clause examples

---

An aggregate function performs a calculation on one or more values and returns a single value.

---

The aggregate function is often used with the GROUP BY clause and HAVING clause of the SELECT statement.

Aggregate functions

# Aggregate functions

- ▶ The most commonly used aggregate functions are:
  - ▶ **COUNT** – counts the number of elements in the group defined
  - ▶ **SUM** – calculates the sum of the given attribute/expression in the group defined
  - ▶ **AVG** – calculates the average value of the given attribute/expression in the group defined
  - ▶ **MIN** – finds the minimum in the group defined
  - ▶ **MAX** – finds the maximum in the group defined

<b>production.products</b>
* product_id
product_name
brand_id
category_id
model_year
list_price

```
SELECT
  AVG(list_price) avg_product_price
FROM
  production.products;
```

avg\_product\_price  
1520.591401

```
SELECT
  COUNT(*) product_count
FROM
  production.products
WHERE
  list_price > 500;
```

product\_count  
213

```
SELECT
  MAX(list_price) max_list_price
FROM
  production.products;
```

max\_list\_price  
11999.99

```
SELECT
  MIN(list_price) min_list_price
FROM
  production.products;
```

min\_list\_price  
89.99

# Aggregate function examples

production.stocks
* store_id
* product_id
quantity

```
SELECT
    product_id,
    SUM(quantity) stock_count
FROM
    production.stocks
GROUP BY
    product_id
ORDER BY
    stock_count DESC;
```

product_id	stock_count
188	86
64	82
109	79
196	79
61	78
182	77
166	77
219	75
142	75
252	75

# Aggregate function examples

# UNIT 6 ASSIGNMENT

# UNIT 6 ASSIGNMENT

▶ Purpose:

- ▶ You are asked to develop SQL DML statements to address the questions presented below.
- ▶ You must use the Northwind database for this assignment.

# UNIT 6 ASSIGNMENT

- ▶ Assignment Instructions:

- ▶ Deploy the Northwind database into your Microsoft SQL Server instance by executing the provided SQL script in a Microsoft SQL Server Management Studio (SSMS) query window.

# UNIT 6 ASSIGNMENT

## Assignment Instructions:

- Once the Northwind database is successfully deployed, generate SQL statements to address the assignment problems.
- Use the provided database design diagram as a guide in forming your statements.

# UNIT 6 ASSIGNMENT

## Assignment Instructions:

- Problem 1: Display the product records with unit prices equal to or greater than \$100.

	ProductID	ProductName	SupplierID	CategoryID	QuantityPerUnit	UnitPrice	UnitsInStock	UnitsOnOrder	ReorderLevel	Discontinued
1	29	Thüringer Rostbratwurst	12	6	50 bags x 30 sausgs.	123.79	0	0	0	1
2	38	Côte de Blaye	18	1	12 - 75 cl bottles	263.50	17	0	15	0

# UNIT 6 ASSIGNMENT

## Assignment Instructions:

- Problem 2: Present the unit value minimum, maximum, average, and standard deviation for current and discontinued products. Group the results based on the “Discontinued”

	Discontinued	Minimum Unit Price	Maximum Unit Price	Average Unit Price	Unit Price Standard Deviation
1	0	2.50	263.50	26.7343	32.464315951983
2	1	4.50	123.79	47.255	41.7765422900733

# UNIT 6 ASSIGNMENT

## Assignment Instructions:

- Problem 3: List suppliers with names starting with “G” in alphabetical order.

	CompanyName
1	Gai pâturage
2	G'day, Mate
3	Grandma Kelly's Homestead

# UNIT 6 ASSIGNMENT

▶ Assignment Instructions:

- ▶ Problem 4: Display the full names of all Employees in FirstName, " ", LastName format.

	Employee Name
1	Nancy Davolio
2	Andrew Fuller
3	Janet Leverling
4	Margaret Peacock
5	Steven Buchanan
6	Michael Suyama
7	Robert King
8	Laura Callahan
9	Anne Dodsworth

# UNIT 6 ASSIGNMENT

## ► Assignment Instructions:

- Problem 5: Display all of the supplier names and HomePage values for NULL HomePage values. Present the results in alphabetical order by supplier name.

	CompanyName	HomePage
1	Aux joyeux ecclésiastiques	
2	Bigfoot Breweries	NULL
3	Cooperativa de Quesos 'Las Cabras'	NULL
4	Escargots Nouveaux	NULL
5	Exotic Liquids	NULL
6	Forêts d'érables	NULL
7	Gai pâturage	NULL
8	Grandma Kelly's Homestead	NULL
9	Heli Süßwaren GmbH & Co. KG	NULL
10	Karkki Oy	NULL
11	Leka Trading	NULL
12	Lyngbysild	NULL
13	Ma Maison	NULL
14	New England Seafood Cannery	NULL
15	Nord-Ost-Fisch Handelsgesellschaft mbH	NULL
16	Norske Meierier	NULL
17	Pasta Buttini s.r.l.	NULL
18	Pavlova, Ltd.	NULL
19	PB Knäckebröd AB	NULL
20	Refrescos Americanas LTDA	NULL
21	Specialty Biscuits, Ltd.	NULL
22	Svensk Sjöföda AB	NULL
23	Tokyo Traders	NULL
24	Zaanse Snoepfabriek	NULL

# UNIT 6 ASSIGNMENT

	Country	Number of Customers
1	Brazil	9
2	France	11
3	Germany	11
4	Mexico	5
5	Spain	5
6	UK	7
7	USA	13

► Assignment Instructions:

- Problem 6: Get the number of Northwind customers in each country that has five or more customers. Present the results in alphabetical order by country name.

# UNIT 6 ASSIGNMENT

- ▶ Assignment Instructions:
- ▶ Problem 7: Get the total product costs (i.e., multiplying the unit price by quantity) for ProductID = 20 along with the associated orders IDs from the OrderDetails table. Provide the results in ascending order based on the order ID.

	OrderID	ProductID	Product Cost
1	10252	20	2592.00
2	10272	20	388.80
3	10292	20	1296.00
4	10372	20	777.60
5	10384	20	1814.40
6	10514	20	3159.00
7	10523	20	1215.00
8	10593	20	1701.00
9	10660	20	1701.00
10	10828	20	405.00
11	10878	20	1620.00
12	10927	20	405.00
13	10953	20	4050.00
14	10986	20	1215.00
15	11021	20	1215.00
16	11077	20	81.00

# UNIT 6 ASSIGNMENT

## Assignment Instructions:

- Problem 8: Select all of the cities where there are employees with no duplicate values displayed. Show the cities in alphabetical order.

	City
1	Kirkland
2	London
3	Redmond
4	Seattle
5	Tacoma

# UNIT 6 ASSIGNMENT

► Assignment Instructions:

- Problem 9: List first and last names for employees who live in London, Seattle, or Redmond. Show the employee's city in the output.

	FirstName	LastName	City
1	Nancy	Davolio	Seattle
2	Margaret	Peacock	Redmond
3	Steven	Buchanan	London
4	Michael	Suyama	London
5	Robert	King	London
6	Laura	Callahan	Seattle
7	Anne	Dodsworth	London

# UNIT 6 ASSIGNMENT

## Assignment Instructions:

- Problem 10: Display all product IDs and names for out-of-stock products having a unit price in the range of \$20 to \$25. Show the units-in-stock value in the results.

	ProductID	ProductName	UnitPrice	UnitsInStock
1	5	Chef Anton's Gumbo Mix	21.35	0

# UNIT 6 ASSIGNMENT

---

**Assignment  
Requirements:**

Microsoft SQL Server Express and SQL Server Management Studio (SSMS) MUST be installed to complete this Assignment.

---

Compose your Assignment in a Word document.

---

## UNIT 6 ASSIGNMENT

### Assignment Requirements:

- Embed the screenshots of your SQL statements and confirmatory output (e.g., query results) into the Word document.
- The assignment is due by the final day of the Unit 6 week.

## UNIT 6 ASSIGNMENT

### Directions for Submitting Your Assignment:

- Name your assignment document according to this convention:  
**IT234\_<YourName>\_Unit6.docx**  
(replace **<YourName>** with your full name).
- Submit your completed assignment to the Unit 6 Assignment Dropbox by the final day of the Unit 6 week.
- Review the Unit 6 Assignment Rubric before beginning this activity.
